

## About Pidoco

Pidoco is a powerful web-based prototyping tool that lets you create interactive prototypes for mobile devices, websites, or desktop applications. The software offers elaborated sharing functions, focuses on quick feedback and supports different project versions in parallel. Super fast and easy to learn, this tool simplifies product creation and speeds up your iteration loops!

### **Ease of use**

Pidoco prototypes can be created without any coding or design experience. A library of more than 400 components and icons allows designers, project managers or developers to build projects from scratch within minutes. Existing designs can be transformed into interactive prototypes in only a few clicks. With global layers and masters, customized elements can be reused across the entire project and highly speed up the product creation.

### **Mobile devices**

The large variety of interactions include all popular touch gestures and page transitions to represent a realistic mobile project. Prototypes can be previewed in the browser or on mobile devices to guarantee a natural interaction behaviour.

### **Sharing & collaboration**

Extensive sharing options like live collaboration, link sharing, commenting, various access rights, and stable APIs are available. To give feedback on a shared project, no Pidoco account is required! Comments can be created with one click, and Pidoco helps keep track of all discussions and manage open tasks.

### **Free and paid plans**

Depending on your requirements, Pidoco offers a free version or paid plans starting from \$19 per month.
